Welcome to Vehicle Physics Pro!

Community Edition

Vehicle Physics Pro (VPP) is an advanced vehicle simulation kit providing fully realistic and accurate vehicle dynamics.

⚠ **This is an advanced vehicle asset** ⚠

Good knowledge of vehicle mechanics, car tuning and real-world set-up techniques is highly recommended. Configuring vehicles in VPP is easy, but setting them up with realistic specifications is almost as difficult as in real vehicles. If you need vehicles that are simple to set up, please consider Edy's Vehicle Physics instead.

Check out the VPP Asset Store page for the product summary and screenshots.

Check out the Changelog section for the release notes of each SDK version:

- Changelog (release notes, version upgrade guides)

Quick documentation links

- Getting Started
- Creating Vehicles
- Configuration Guide

- Support Q&A

Requirements

- **Supported Unity versions:** Unity 6.0 LTS or newer LTS.
- **Physics for Game Objects:** Simulation Mode set to *FixedUpdate*

Vehicle Physics Pro may work in other Unity versions, but official support might not be guaranteed for non-LTS Unity releases.

Configuring the Project Settings

It is recommended to use **Linear color space** (*Project Settings → Player → Other Settings*) for the example scenes to look correctly.

Project Settings → Physics

Requirements:

- GameObjects SDK: Tested with PhysX
- Settings → GameObject
    - Simulation Mode: Fixed Update
    - Solver Type: Projected Gauss Seidel

Recommended at Settings → GameObject:

- Enable Adaptive Force: Disabled
- Contact Pairs Mode: Enable All Contact Pairs
- Friction Type: Patch Friction Type
- Improved Patch Friction: Enabled

Project Settings → Tags And Layers

VPP uses **User Layer 8** as **Vehicles** for identifying the vehicles in the provided demo scenes and examples. Used for visibility and reflection probes.

Quick start

1. Import the example and demo scenes from the **Package Manager**. Locate the VPP package, select **Samples**, click **Import**.
2. Locate the scenes at the folder Samples → Vehicle Physics Pro - Community Edition → [Version] → Demo Scenes and Vehicles → Scenes.
3. The ***Demo*** scenes are complete demos in *The City* scenario. Try them!
   Open the help (**?** icon) > *Controls* for the car controls.
4. The ***Getting Started*** scenes contain a minimal working scene with the car, a test scenario and the camera controller. Use them while following the Getting Started section in the docs for learning how vehicles work in VPP.

Getting support

This is a free asset. Please search the documentation and ask your questions in the Support Q&A site when possible. Otherwise, you may reach us at info@vehiclephysics.com.

You may also reach us on X, Instagram, etc. Search for **@VehiclePhysics** in your favourite social network.
